

Construction Management Plan guidelines

The City of Melbourne requires developers and builders to carefully manage excavation, demolition and building works within its municipal boundaries.

To achieve this, builders and developers are required to submit a construction management plan that takes into account all relevant aspects of demolition or building work.

The guidelines address a range of issues to be managed onsite including:

- public safety, amenity and site security
- operating hours
- noise and vibration controls
- air and dust management
- stormwater and sediment control
- waste and materials re-use and traffic management

The Construction Management Plan Guidelines have been updated following consultation with the building industry and the community.
