

Plant Care in Winter

- Adjust watering – the **most important** factor in plant care. Watering can be much less, only when dry and in the morning, if possible
- Adjust location if beneficial to get more light – winter light is gentle
- Temperature – between 15 – 24 C
- Humidity – group plants together, set them in a tray of pebbles with water
- Plants like to be grouped together – they create and share a climate
- No need to feed or fertilise – it is a dormant time
- Monitor location – keep away from heat sources, radiators, draughts
- Not a time to re-pot or prune
- Know your plant – they vary as much as people
